ANALYST NOTE

Hera local LLM

The +40.41% ROI and 66.7% win rate suggest a strong directional edge for LPG, but the sample size of only three trades renders the 1.10 Sharpe ratio statistically meaningless. The 21.82% max drawdown is disproportionately high relative to the modest profit, indicating that position sizing or stop-loss placement likely amplified volatility without adequate risk controls. This strategy lacks the statistical confidence required for institutional deployment, as a single losing trade could erase the entire observed gain. To validate the alpha, you must expand the backtest window to include at least 100 trades or test the logic on a different asset class with higher liquidity.
