ANALYST NOTE

Hera local LLM

The EVO_EVOEVOEVOE_v840 strategy on AMZN failed catastrophically with a -2.39% ROI and -0.12 Sharpe ratio, driven by a severe 17.43% drawdown on only three trades. Such a tiny sample size renders any statistical significance meaningless, as the results likely reflect random noise rather than a flawed logic. The 33.3% win rate confirms the model is currently in a regime where edge does not exist for this specific setup. We must expand the backtest to a longer historical window and test alternative parameters to validate if this loss is an anomaly or a structural flaw. Adjusting the entry filters or reducing position size is the immediate next step before redeploying live capital.
