ANALYST NOTE

Hera local LLM

The EVO_EVOVOGG1R_v1655 strategy on ASC generated an 18.35% return, yet the statistical significance is critically weak given only three trades. While the 66.7% win rate and 0.82 Sharpe ratio suggest potential, the 17.18% maximum drawdown indicates high volatility risk not adequately captured by such a small sample. Relying on this performance metric without expanding the dataset to at least fifty trades creates a false sense of security and overfits to recent noise. To validate the edge, we must run a forward test with live capital or a significantly larger backtest horizon to confirm consistency. This approach is necessary before any capital allocation decision is considered.
