ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v1139 strategy on AMZN failed catastrophically with a -2.39% ROI and a negative Sharpe ratio of -0.12, indicating a net loss relative to the risk-free rate. Such a poor win rate of 33.3% alongside a max drawdown of 17.43% suggests the signal logic lacks robustness against recent AMZN volatility. With only three total trades, the statistical sample size is insufficient to distinguish between a flawed algorithm and mere random noise. Immediate recalibration of entry thresholds or exclusion of high-implied volatility periods is required before re-evaluation. This simulation confirms the need for stricter risk filters before live deployment.
