ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v1302 strategy on LPG shows promising initial alpha with a 42.10% ROI, yet the statistical significance is critically weak due to only three executed trades. A win rate of 66.7% suggests effective entry logic, but the 21.82% maximum drawdown reveals substantial volatility risk that is impossible to assess reliably with such a shallow sample size. The 1.14 Sharpe ratio indicates acceptable risk-adjusted returns for a short-term simulation, though it lacks robustness for live deployment. We must expand the backtest parameters to include a broader historical window to validate consistency before considering live capital allocation.
