ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v42 strategy on LPG generated a 36.3% return with a 66.7% win rate, yet the statistical significance is negligible due to only three executed trades. A maximum drawdown of 21.8% indicates high volatility exposure, while the Sharpe ratio of 1.04 suggests mediocre risk-adjusted efficiency relative to the drawdown risk. This sample size fails to confirm robustness, as results could easily be attributed to outlier luck rather than a reliable edge. We must expand the out-of-sample dataset by running a longer historical simulation before deploying live capital. The strategy requires further stress testing to validate performance consistency across different market regimes.
