ANALYST NOTE

Hera local LLM

The EVO_EVOEVOEVOE_v2372 strategy on AMZN produced a -6.61% drawdown with a Sharpe of -0.47 across only three trades, rendering the statistical signals insignificant and the negative alpha non-actionable at this scale. The severe 17.84% max drawdown indicates fragile risk controls that likely failed to filter high-volatility environments, resulting in a poor win rate of just 33.3%. With such a sparse sample size, any observed pattern is indistinguishable from random noise rather than a replicable edge, making immediate deployment highly inadvisable. We must expand the backtest horizon or adjust entry filters to gather sufficient data points before considering parameter optimization. Next steps involve re-running the simulation on a longer
