ANALYST NOTE

Hera local LLM

The EVO_EVOEVOEVOE_v1706 strategy on AAPL generated a +10.70% ROI, yet a mere two trades provide insufficient statistical confidence to validate the signal logic. The 50% win rate and 11.50% drawdown suggest a lack of edge and poor risk containment relative to the capital exposure. Sharpe ratios above 0.8 are often noise without higher trade frequency to confirm consistency across market regimes. Next, expand the sample size by backtesting over a 24-month period with 5-minute intervals to stress-test entry timing and volatility filters.
